NVM Express Technical Proposal for New Feature

Technical Proposal ID	TP4141 Storage Tag Mask Enhancements
Change Date	2022-08-15
Builds on Specification	NVM Express NVM Command Set 1.0b
References Specification	TP4095a Namespace Capability Reporting

Technical Proposal Author(s)

Name	Company
Judy Brock, Mike Allison, Bill Martin	Samsung
Walt Hubis	Micron

This proposal defines optional support for Storage Tag restrictions. In particular, it defines two levels of restricted support for Storage Tag Masking:

- Byte Granularity Masking
- Masking Not Supported

Revision History

Revision Date	Change Description
2022-02-04	Initial version
2022-02-11	Add text indicating error will be returned if LBSTM field bit masking restrictions are not met during namespace create operation.
2022-02-23	Incorporate Phase 2 feedback from WG walk-thru
2022-03-22	Phase 3 draft – add “Reported” column to Identify data structures. No further feedback received.
2022-04-04	Incorporate feedback from Dell EMC (David Black)
2022-04-05	Slight modification to QPIF field language
2022-04-07	Another modification to QPIF field language
2022-04-28	<ul style="list-style-type: none">• In one case, 16BPISTM needs to be qualified by QTYPE• STMLA field needs to be further qualified by PIF=QTYPE• PIF=QTYPE value should only be allowed if Qualified Protection Information Format Support is enabled
2022-04-29	word-smithing from WG review of 04/28 changes
2022-07-29	Integrated
2022-08-15	Updated editorial comments per Mike Allison

Description for Changes Document for

NVM Express NVM Command Set Specification 1.0b

Feature Enhancement:

- Added the Qualified Protection Information Format Support (QPIFS) field to the NVM Command Set I/O Command Set specific Identify Namespace data structure (CNS 05h) (CSI 00h)
- Updated the 16BPISTS field to take the QPIFS field into account
- Added the Qualified Protection Information Format (QPIF) field to the Extended LBA Format Data Structure, NVM Command Set specific. This field indicates Protection Information Formats that are qualified by the Storage Tag Mask constraints.
- Defined a new coded value (QTYPE = 11b) to the PIF field which points to Protection Information Formats that are defined by the QPIF field
- Added the Storage Tag Masking Level (STML) field to the NVM Command Set I/O Command Set specific Identify Namespace data structure (CNS 05h) (CSI 00h)
- Updated the legal LBSTM field options to be qualified by the value in new Storage Tag Masking Level (STML) field.

New requirement / incompatible change:

- none
- References:
 - TP4141

Markup Conventions:

Black:	Unchanged (however, hot links are removed)
Red Strikethrough:	Deleted
Blue:	New
Blue Highlighted:	TBD values, anchors, and links to be inserted in new text.
<Green Bracketed>:	Notes to editor
Orange:	From TP4095a

Modify portions of NVM Command Set Specification 1.0b as shown below:

Modify figure 100 in section 4.1.5.3 as shown below:

I/O Command Set Specific Identify Namespace Data Structure (CNS 05h)

Figure 100 defines the I/O Command Set specific Identify Namespace data structure for the NVM Command Set.

Figure 100: NVM Command Set I/O Command Set Specific Identify Namespace Data Structure (CSI 00h)

Bytes	O/M 1	Description	Reported ²										
7:0	O	<p>Logical Block Storage Tag Mask (LBSTM): Identifies the mask for the Storage Tag field for the protection information (refer to section 5.1). 16b Guard Protection Information	0	32											
32b Guard Protection Information	16	64											
64b Guard Protection Information	0	48											

Modify Section 4.1.6 as shown below:

4.1.6 Namespace Management command

The Namespace Management command operates as defined in the NVMe Base Specification.

The host specified namespace management fields are specific to the I/O Command Set. The data structure passed to the create operation for the NVM Command Set (CSI 00h) is defined in Figure 1. Fields that are reserved should be cleared to 0h by host software. After successful completion of a Namespace Management command with the create operation, the namespace is formatted with the specified attributes.

If the LBA Format Extension Enable (LBAFEE) field is not set to 1h in the Host Behavior Support feature (refer to the Host Behavior Support section in the NVMe Base Specification), then a controller aborts a Namespace Management command with a status code of Invalid Namespace or Format that specifies to create a namespace that is formatted with (refer to section 5.2.1):

- a) 16b Guard Protection Information with the STS field set to a non-zero value;
- b) 32b Guard Protection Information; or
- c) 64b Guard Protection Information.

Implementations may impose requirements on which bits are allowed to be masked in the Logical Block Storage Tag Mask field (refer to Figure 105). Those requirements are defined in the LBSTM field in Figure 100 and the Storage Tag Masking Level Attribute field in Figure 100. If any of the requirements specified in those two fields are not met, then the controller shall abort the command with a status code of Invalid Field in Command.

Figure 1: Namespace Management – Host Software Specified Fields

Bytes	Description	Host Specified
Fields that are a subset of the Identify Namespace data structure (refer to Figure 97)		
07:00	Namespace Size (NSZE)	Yes
15:08	Namespace Capacity (NCAP)	Yes
25:16	Reserved	
26	Formatted LBA Size (FLBAS)	Yes
28:27	Reserved	
29	End-to-end Data Protection Type Settings (DPS)	Yes
30	Namespace Multi-path I/O and Namespace Sharing Capabilities (NMIC)	Yes
91:31	Reserved	
95:92	ANA Group Identifier (ANAGRPID) ¹	Yes
99:96	Reserved	
101:100	NVM Set Identifier (NVMSETID) ¹	Yes
103:102	Endurance Group Identifier (ENDGID)	Yes
383:104	Reserved	
Fields that are not a subset of the Identify Namespace data structure.		
391:384	Logical Block Storage Tag Mask (LBSTM)	Yes
511:392	Reserved	
Notes:		
1. A value of 0h specifies that the controller determines the value to use (refer to the Namespace Management section of the NVMe Base Specification). If the associated feature is not supported, then this field is ignored by the controller.		

Modify Section 5.2.3 as shown below:

5.2.3 Control of Protection Information Checking - PRCHK

Checking of protection information consists of the following operations performed by the controller.

- ...
- ... If a Storage Tag field is defined in the protection information (refer to section 5.2.1.4) and the Storage Tag Check bit in the command is set to '1', then the controller compares unmasked bits in the Storage Tag field to the Logical Block Storage Tag (LBST) field of the command. A bit in the Storage Tag field is masked (i.e., not compared) if the corresponding bit is cleared to '0' in the [Logical Block Storage Tag Mask \(LBSTM\)](#) field in the NVM Command Set Identify Namespace data structure (refer to Figure 100). [Implementations may limit support for the bits that are allowed to be masked in the Logical Block Storage Tag Mask as described in the Storage Tag Masking Level Attribute field \(refer to Figure 100\).](#)
