- Extending NVM Express Efficiency: NVMe over Fabrics
- Expert Round Table
What’s the Difference between NVM and NVMe?

- **NVM** stands for *Non-Volatile Memory*
  - Flash, SSDs, NVDIMMs, all qualify

- **NVMe** stands for *NVM Express*
  - An interface to the controller for NVM
  - A mechanism for providing commands to the drives
NVM Express – Architected for NVM

- NVM Express is a standardized high performance software interface for PCIe SSDs
  - Standardizes register set, feature set, and command set where there were only proprietary PCIe solutions before
  - Architected from the ground up for NAND and next generation NVM
  - Designed to scale from Enterprise to Client systems

- Developed by an open industry consortium with a 13 company Promoter Group
PCI Express SSD Benefits

- Lower **latency**: Direct connection to CPU
- Scalable **performance**: 1 GB/s per lane – 4 GB/s, 8 GB/s, … in one SSD
- Industry **standards**: NVM Express and PCI Express (PCIe) 3.0
- Increased **I/O**: Up to 40 PCIe lanes per CPU socket
- **Security** protocols: Trusted Computing Group Opal
- **Low Power** features: Low power link (L1.2), NVMe power states
- **Form factors**: SFF-8639, SATA Express*, M.2, Add in card, Future: BGA (PCI SIG)
NVMe Technical Overview

- Supports deep queues (64K commands per queue, up to 64K queues)
- Supports MSI-X and interrupt steering
- Streamlined & simple command set (13 required commands)
- Optional features to address target segment
  - Data Center: End-to-end data protection, reservations, etc.
  - Client: Autonomous power state transitions, etc.
- Designed to scale for next generation NVM, agnostic to NVM type used

NVM Express* (NVMe)
NVMe Delivers Best in Class IOPs

- 100% random reads: NVMe has > 3X better IOPs than SAS 12Gbps
- 70% random reads: NVMe has > 2X better IOPs than SAS 12Gbps
- 100% random writes: NVMe has ~ 1.5X better IOPs than SAS 12Gbps

Best in Class Sequential Performance

- NVM Express (NVMe) delivers > 2.5GB/s of read and ~ 2 GB/s of write performance
  - 100% reads: NVMe has >2X better performance than SAS 12Gbps
  - 100% writes: NVMe has >2.5X better performance than SAS 12Gbps

Analyzing What Matters

• What matters in today’s Data Center is not just IOPs and bandwidth
• Let’s look at efficiency of the software stack, latency, and consistency

Server Setup

• Basic 4U Intel® Xeon® E5 processor based server
• Out of box software setup
• Moderate workload: 8 workers, QD=4, random reads

Latency of NVM Express

- The efficiency of NVMe directly results in leadership latency
- NVMe is more than 200 μs lower latency than 12 Gb SAS

EMC’s Perspective: A Look Back

• Several years ago, the storage industry was at a crossroad, with regard to SSDs
• SAS and SATA SSDs were popular, but it was expected that use of PCI Express SSDs would grow dramatically, due to performance benefits
• Without standardization, there would have been many disparate hardware and software solutions for PCIe SSDs
• A group of companies joined together and created the NVM Express Specification

“EMC is the leader in providing SSDs to the market in enterprise storage systems, and believes standards are in the best interest of the industry”

“By standardizing many enterprise-class features, the NVMe specification is enabling the industry to deliver higher performance PCIe SSDs without compromising on expectations for drive functionality—which is especially important as customers continue transforming their IT infrastructures.”

Bill DePatie
Senior Vice President, Global Platform Engineering
EMC
EMC’s Perspective: The Present

• Flash has become an indispensable component of Data Center storage
  • EMC, through development and acquisition, has invested in Flash at every level, including:
    - Server Flash
    - Hybrid Arrays
    - All-Flash Arrays

• Future Non-Volatile Media holds the promise of even greater performance and capabilities
  • The NVMe specification defines a highly efficient standardized interface for the media of today and tomorrow

• EMC was able to reduce the hardware/software development and validation time for a high performance NVRAM design, thanks to NVM Express controllers and drivers
  • More info can be found at: http://www.nvmexpress.org/presentations
EMC’s Perspective: A Look Forward

- Once again, the storage industry is at a crossroad
  - This time, with respect to “NVMe over X”, where “X” could be any existing I/O protocol

- The NVMe Specification did such a good job of defining an efficient queuing interface for storage, there is now a desire to extend it to other protocols
  - These mature protocols are already established within the Data Center, and have certain advantages over PCI Express, in terms of robustness and error handling

- Without standardization, there could be many disparate implementations, by protocol or by silicon vendor

- The NVMe group has taken up the call to address this, with “NVMe over Fabrics”

“EMC is pleased to be a core contributor to the definition of NVMe over Fabrics, the new NVM Express standard for sharing next-generation flash storage in an RDMA-capable fabric.”

Mike Shapiro
Vice President, Software Engineering of DSSD

A primary use case for NVM Express (NVMe) is in a Flash Appliance.

Hundreds or more SSDs may be attached – too many for PCI Express based attach.

Concern: Remote SSD attach over a fabric uses SCSI based protocols today – requiring protocol translation(s).

Desire best performance and latency from SSD investment over fabrics like Ethernet, InfiniBand™, Fibre Channel, and Intel® Omni Scale Fabric.
Realizing Benefit of Next Gen NVM over Fabrics

- NVM Express (NVMe) SSD latency may be < 10 µs with next generation NVM
- Using a SCSI-based protocol for remote NVMe adds over 100 µs in latency

**Concern:** Low latency of next gen NVM lost in (SCSI) translation.

Extend efficiency of NVMe over front and back-end fabrics.
Why NVM Express over Fabrics?

• Simplicity, Efficiency and End-to-End NVM Express (NVMe) Model
  - NVMe supports up to 64K I/O Queues with 3 required commands
  - Inherent parallelism of multiple I/O Queues is exposed
  - Simplicity of protocol enables hardware automated I/O Queues – transport bridge
  - No translation to or from another protocol like SCSI (in firmware/software)
  - NVMe commands and structures are transferred end-to-end
  - Maintains consistency between fabric types by standardizing a common abstraction

Goal: Make remote NVMe equivalent to local NVMe, within ~ 10 µs latency.
The NVM Express (NVMe) Workgroup has started the definition of NVMe over Fabrics.

A flexible transport abstraction layer is under definition, enabling a consistent definition of NVMe over many different fabrics types.

The first fabric definition is the RDMA protocol family – used with Ethernet (iWARP and RoCE) and InfiniBand™.

Expect future fabric definitions; such as Fibre Channel and Intel® Omni-Scale fabrics.
NVMe over Fabrics Prototype on iWARP

- Recall: Goal is remote NVM Express (NVMe) equivalent IOPS to local NVMe and no more than 10 µs added latency
- Prototype delivers 460K IOPs for both the local and remote PCIe NVMe SSD devices
- Remote NVMe adds 8 µs latency versus local NVMe access (4K Read & Write; QD=1)
- Demonstrates the efficiency of NVMe End-to-End; NVMe Target software running on one CPU core (two SMT threads) at 20% utilization
